The AGU headquarters building, which is over 20 years old, is in need of significant system upgrades and improvements. In keeping with AGU's mission, the organization is researching ways to renovate the building that could achieve a net zero\* energy goal.

After months of research, the team has determined that in order to achieve the net zero goal, the project would require historic preservation and zoning approval. The project is currently undergoing ANC review which is your opportunity to provide feedback as members of the public.

Please join your ANC representatives, AGU leadership, and team members for an informational session about the project and what it will mean to the neighborhood, the city and how this project could set a new national standard in environmental building practices.

If you are unable to attend the reception please contact [renovation@agu.org](mailto:renovation@agu.org) and/or Commissioner Warwick at [Daniel.Warwick@anc.dc.gov](mailto:Daniel.Warwick@anc.dc.gov) for more information.

*\*"Net zero" means the building, through innovative technologies and sustainable materials, reduces the use of energy, water, and waste production to no impact on the environment—reducing the carbon footprint and potentially being net-positive, providing energy back to the grid.*
